

описано применение методики испытания конверсионных самозалечивающихся покрытий на основе оцинкованной стали, содержащих в своем составе церий и лантан. Испытание осуществлялось следующим образом: на поверхность покрытия наносили царапины с помощью режущего инструмента и затем погружали в раствор 0,003 М NaCl. По фотографиям, сделанным на сканирующем электронном микроскопе до погружения в раствор и спустя 24 часа после испытания, оценивали внешний вид царапины,

элементный состав в ней определяли с помощью энергодисперсионного рентгеноспектрального микроанализа.

Таким образом, приведенный анализ современного состояния нормативной документации и литературных данных по испытаниям защитных конверсионных покрытий со способностью регенерации показал актуальность дальнейшего дополнения и корректировки нормативных документов по методам испытаний с введением в них новых видов и способов оценки качества покрытий. ■

### key words

standards, test methods, protective coatings

Conversion coatings are protective coatings that are obtained as a result of a chemical reaction directly on the metal surface. The use of self-healing conversion coatings is important for the protection of metals from corrosion and wear, they are most in demand in the automotive, construction and aerospace industries. The current regulatory and technical documentation on quality control of conversion coatings and controlled indicators are considered. The analysis of the quality indicators of coatings with the function of self-regeneration is carried out. Information on the development of test methods for self-healing coatings and description of the method of testing conversion coatings for the ability to self-heal is given.
