We have analyzed the methods of continuous improvement and the experience of creating systems for proposing improvements to enterprises based on the Lean production methodology and tools. Continuous improvement is one of the principles of quality management systems and Lean production.

The policy of continuous improvement in Japan is determined by the kaizen philosophy. This is a hard, deliberate process of continually improving all aspects of an organization's activities in order to increase value and reduce losses, in which all company employees are involved. Employees are given the right, tools and methodology to find opportunities for improvement and make changes. The Kaizen-offers system stimulates the growth of the personal and professional development of each team member, provides a basis for continuous improvements, allowing the company to remain stable in today's competitive environment.
