key words

self-regulation principles, food safety, system quality indicators

We examined the current state of beekeeping in Russia, identified and analyzed the most significant problems that this sector of agriculture faces today. We talked about the principles of creating self-regulatory organizations and noted the advisability of introducing this progressive way of developing good business in the practice of combining numerous beekeeping farms aimed at strengthening organizational, scientific, technical and material private-state partnerships in the industry. Only the unification of fragmented beekeeping farms into professional self-regulatory associations (as the most effective structure of progressive public-private partnership) can protect farms. This will provide them with vital tools (management, planning, security, lending, scientific, technical, legal support, etc.), all that one or several individual households cannot afford.
