key words

arctic supporting zone,
measurement technologies,
measurement information,
calibration, verification

The importance of technology for obtaining measurement information is noted in terms of amendments to the Constitution of the Russian Federation and the innovative development of the Arctic zones of the Russian Federation.

We have substantiated the necessity of an integrated approach to the processes of measurement and transfer of units of quantities. The issues of transport logistics and the structure of metrological laboratories in the focal nature of development and extreme climatic conditions of the Arctic supporting zones are considered. We believe that moving measuring instruments and standards to distant residential settlements is impossible without helicopters. In addition, they can be used to create a real mobile laboratory of measuring equipment.
