The paper considers the integration of information security risk management and practical examples of successful implementation of integrated risk approaches, analysis of their impact on corporate processes, as well as proposals for effective integration into long-term business strategies. Information security risk management should be viewed as a dynamic system based on predictive analysis and proactive response, which allows companies to form a sustainable business model capable of adapting to changes in the digital landscape. It is concluded that the integration of risk management and compliance into a sustainable development strategy is not just a necessity, but an important step towards success in the face of constant challenges.
