key words

methodology, plan of supplies,
material supplies, state purchases,
price, suppliers, optimization

I propose a method of products supplies plan substantiation and services for the system of material supplies of the Armed Forces of Russian Federation taking into account the norms of the Federal Law of 5 April 2013 N 44-FZ On the contract system in the field of procurement of products and services for state and municipal needs. The paper analyzes ways of use of this method taking into account the solution of the problem of material supplies for the armed forces.

The practical significance of the proposed methodology is associated with the justification of a rational price in the process of weapons public procurement, military, special equipment and material resources. This method allows you to scientifically justify the price by determining the economically justified costs and the minimum necessary profit of the manufacturer (supplier). Besides it adjust the price based on specific conditions for the supply of products or services, including investment risks, the choice of suppliers, taking into account the quality of the products supplied and the available production and logistics capacities.
