key words

vocational and professional competences, standardization, metrology, quality management, production practice

The main task of higher educational institutions is to prepare competent specialists, armed with modern knowledge, provided with professional and personal culture, meeting the requirements of their future employers. One of the main components of the educational process was and remains practical training of students.

In this article we have discussed how and where the students of the Quality Management and Technology of Aquatic Bioresources Department of the Voronezh State University of Engineering Technologies pass their practical training. We have formulated the goals and objectives of practical exercises and made recommendations for their improvement.

We believe that the implementation of the proposed measures will increase the mutual responsibility of both employers and the faculty members of the department. This will ultimately lead to the improvement of the educational process at the university, the competence of graduates, and their relevance in modern labor markets.
