key words

professional standards,
professional and public
accreditation, standardization,
metrology, conformity assessment

We believe that at present organizations, including innovative and high-tech industries, need to develop and improve professional standards in the field of technical regulation, standardization and metrology. It is necessary to develop methodological approaches for a substantive analysis of labor functions and job descriptions, and not just the positions and professions of employees of organizations subordinate to Rosstandart. It is required to analyze them for compliance with current professional standards in the sphere of Rosstandart's activity, taking into account promising professional standards of the Commission for Standardization, Metrology and Conformity Assessment of the Council for Professional Qualifications in Mechanical Engineering. When developing new or updating existing federal state educational standards and approximate basic educational programs, it is necessary to combine them with professional standards.
