key words

environment, enterprise, negative impact on environment, Best Available Technologies, Information and Technical Reference book, integrated environmental permit

The article offers an analysis of the legal regulation in the field of granting integrated environmental permits. It provides an overview of the current and expected legislation aiming at the transition of industry to new, technological regulation, as well as regulating relations between the authorities and industry in the process of technological modernization on the basis of Best Available Techniques.

The experience of interaction of pilot enterprises with state authorities within the permitting procedure will be considered in the next article. Training of representatives of government authorities considering applications and employees of industries and consulting companies involved in the development of these applications remains a very important issue. This problem requires an integrated approach developed at the state level, we believe. It can be solved by running centralized training of specialists, for instance, within the framework of the Federal project 'Implementation of the Best Available Techniques'.
