key words

Arctic, standardization, contract, equipment, technology, standards, technical committee, aircraft, helicopters, Northern Sea Route

In this article, we have considered the algorithm for introducing ideas about polar implementation in different areas of activity and its regulatory and legal support for projects in the northern regions. We believe that active infrastructural development of the Russian Arctic is justified not only by its rich natural resources, but also by the strategic logistics opportunities that open up for the domestic economy. Therefore, the development of a complex Arctic standards is a necessary step in the implementation of successful activities in the Russian Arctic.

Conducting research in the Arctic is aimed at studying and its scientific description, creating samples of high-tech products that can function in polar conditions, as well as developing recommendations for the organization of human activity in northern latitudes. The activity of TC 187 contributes to the strengthening of Russia's priority positions in this region.
